At the exterior edge of the boundary layer, i.e. for  $y \rightarrow \infty$ ,  $u \rightarrow U$ , the inviscid slipping velocity:  $u_e(x)$  is here constant and equal to the free stream velocity  $U$ . We seek an asymptotic solution to the equations where  $u = u(y)$ . Hence, the continuity equation gives,  $\partial v / \partial y = 0$  i.e.  $v$  is independent of  $y$ , so  $v = -v_0$ .

Blasius Solution for a Flat Plate Boundary Layer The first exact solution to the laminar boundary layer equations, discovered by Blasius (1908), was for a simple constant value of  $U(s)$  and pertains to the case of a uniform stream of velocity,  $U$ , encountering an infinitely thin flat plate set parallel with that stream as shown in Figure 1:

THE BOUNDARY-LAYER EQUATIONS As Prandtl showed for the first time in 1904, usually the viscosity of a fluid only plays a role in a thin layer (along a solid boundary, for instance). Prandtl called such a thin layer "Übergangsschicht" or "Grenzschicht"; the English terminology is boundary layer or shear layer (Dutch: grenslaag).

## BOUNDARY LAYERS IN FLUID DYNAMICS

Laminar boundary layers can be loosely classified according to their structure and the circumstances under which they are created. The thin shear layer which develops on an oscillating body is an example of a Stokes boundary layer, while the Blasius boundary layer refers to the well-known similarity solution near an attached flat plate held in an oncoming unidirectional flow and Falkner-Skan ...

Boundary Layer Parameter (thicknesses) Most widely used is  $\delta$  but is rather arbitrary  $y = \delta$  when  $u = 0.99 U_\infty$

Highlights A class of new similarity transformations was introduced to study the nanofluid boundary layer flow with heat generation or absorption. We used Lie group analysis for governing equation and auxiliary conditions are converted to ordinary differential equations. The results shed a new light on boundary layer flow with different parametric effects.

In physics and fluid mechanics, a Blasius boundary layer (named after Paul Richard Heinrich Blasius) describes the steady two-dimensional laminar boundary layer that forms on a semi-infinite plate which is held parallel to a constant unidirectional flow. Falkner and Skan later generalized Blasius' solution to wedge flow (Falkner-Skan boundary layer), i.e. flows in which the plate is not ...

The solution given by the boundary layer approximation is not valid at the leading edge. It is valid downstream of the point  $x=0$ . We would like to reduce the boundary layer equation (3.27) to an equation with a single dependent variable. We consider the stream function related to the velocities  $u$  and  $v$  according to the equations
