Digital signal processors are used for a wide range of applications, from communications and control to speech and image processing.

Digital Signal Processor - an overview | ScienceDirect Topics

Digital signal processing (DSP) is the use of digital processing, such as by computers or more specialized digital signal processors, to perform a wide variety of signal processing operations. The digital signals processed in this manner are a sequence of numbers that represent samples of a continuous variable in a domain such as time, space, or frequency.

Digital signal processing - Wikipedia

The study of the digital representation of signals is known as digital signal processing. It converts all the real world signals into digital form with the aid of an Analog to Digital Converter. On completion of the processing, the digital signal is converted back to Analog form using Digital to Analog Converter.
