step by step through the process of creating a Solver model, using a Product Mix example. We'll first show you how to (1) load the solver into your spreadsheet, (2) define the problem and write out formulas for the objective and constraints, and (3) solve the problem. We will focus on Microsoft Excel (Mac and PC) and LibreOffice.

Quick Tutorial for Spreadsheet Solver - edX
We use Excel Solver to find optimal values for the limits a and b which maximize an integral objective function $b \int a f(x) - dx$ subject to the constraint $a < b$. For illustration we will use the parabola $f(x) = 1 - x^2$ for which we easily see from the graph that the maximum positive integral of $f(x)$ is achieved when $a = -1$ and $b = -1$.

Solver in Excel - Easy Excel Tutorial
We'll leverage the macro recorder in Excel to handle most of the actual code. The record macro tool will allow Excel to convert our manual steps into VBA code. We will then identify the key pieces of code to change. Then we will create a loop to dynamically select and replace these values and run the solver again.
