Solution mining, the extraction of metals, minerals and materials from the earth through leaching and fluid recovery is a growing field. The annual economic value of solution mining metals in the USA exceeds that of metal extracted by underground mining.

What is Solution Mining? SMRI views solution mining as mining of underground, water-soluble minerals, usually using one or more drilled wells to dissolve the minerals with water (not by using acids used in metal ore leaching).

Minerals such as salt, potash, trona, and magnesium salts may be produced by pumping saturated fluid from underground caverns.

process used to recover minerals such as copper and uranium through boreholes drilled into a deposit, in situ. In situ leach works by artificially dissolving minerals occurring naturally in a solid state. For recovery of material occurring naturally in solution, see: Brine mining. The process initially involves the drilling of holes into the ore deposit.
