A bone fracture is usually treated with a cast and/or splint. A cast or splint will immobilize the bone (keep it from moving) in order to encourage the bones to align (straighten) and to prevent use of the bone. In some cases when the bone is small (toes or fingers), no cast is needed and the fracture is immobilized by wrapping.

Bone Fractures Management and Treatment | Cleveland Clinic

Pain usually decreases before the fracture is solid enough to handle a complete return to sports, so working with a therapist on a rehab protocol is important to avoid further injury. Once the bone is healed and strong, it's safe to begin muscle building. During the disuse, the muscles will have atrophied and be extremely weak.
